ThoughtWorks®

The work leading to this publication has received funding from the European Union's Seventh Framework Programme (FP7/2007 – 2013) under grant agreement n° 610349.

The content of this report reflects only the author's view and that the Commission is not responsible for any use that may be made of the information it contains.

INTRODUCTION

Helsinki city council already publishes an API detailing the municipal decisions made by the city council.

As part of the DCENT project ThoughtWorks, OKFI and Forum Virium conducted a three day workshop to investigate using social technology for democracy

ThoughtWorks®

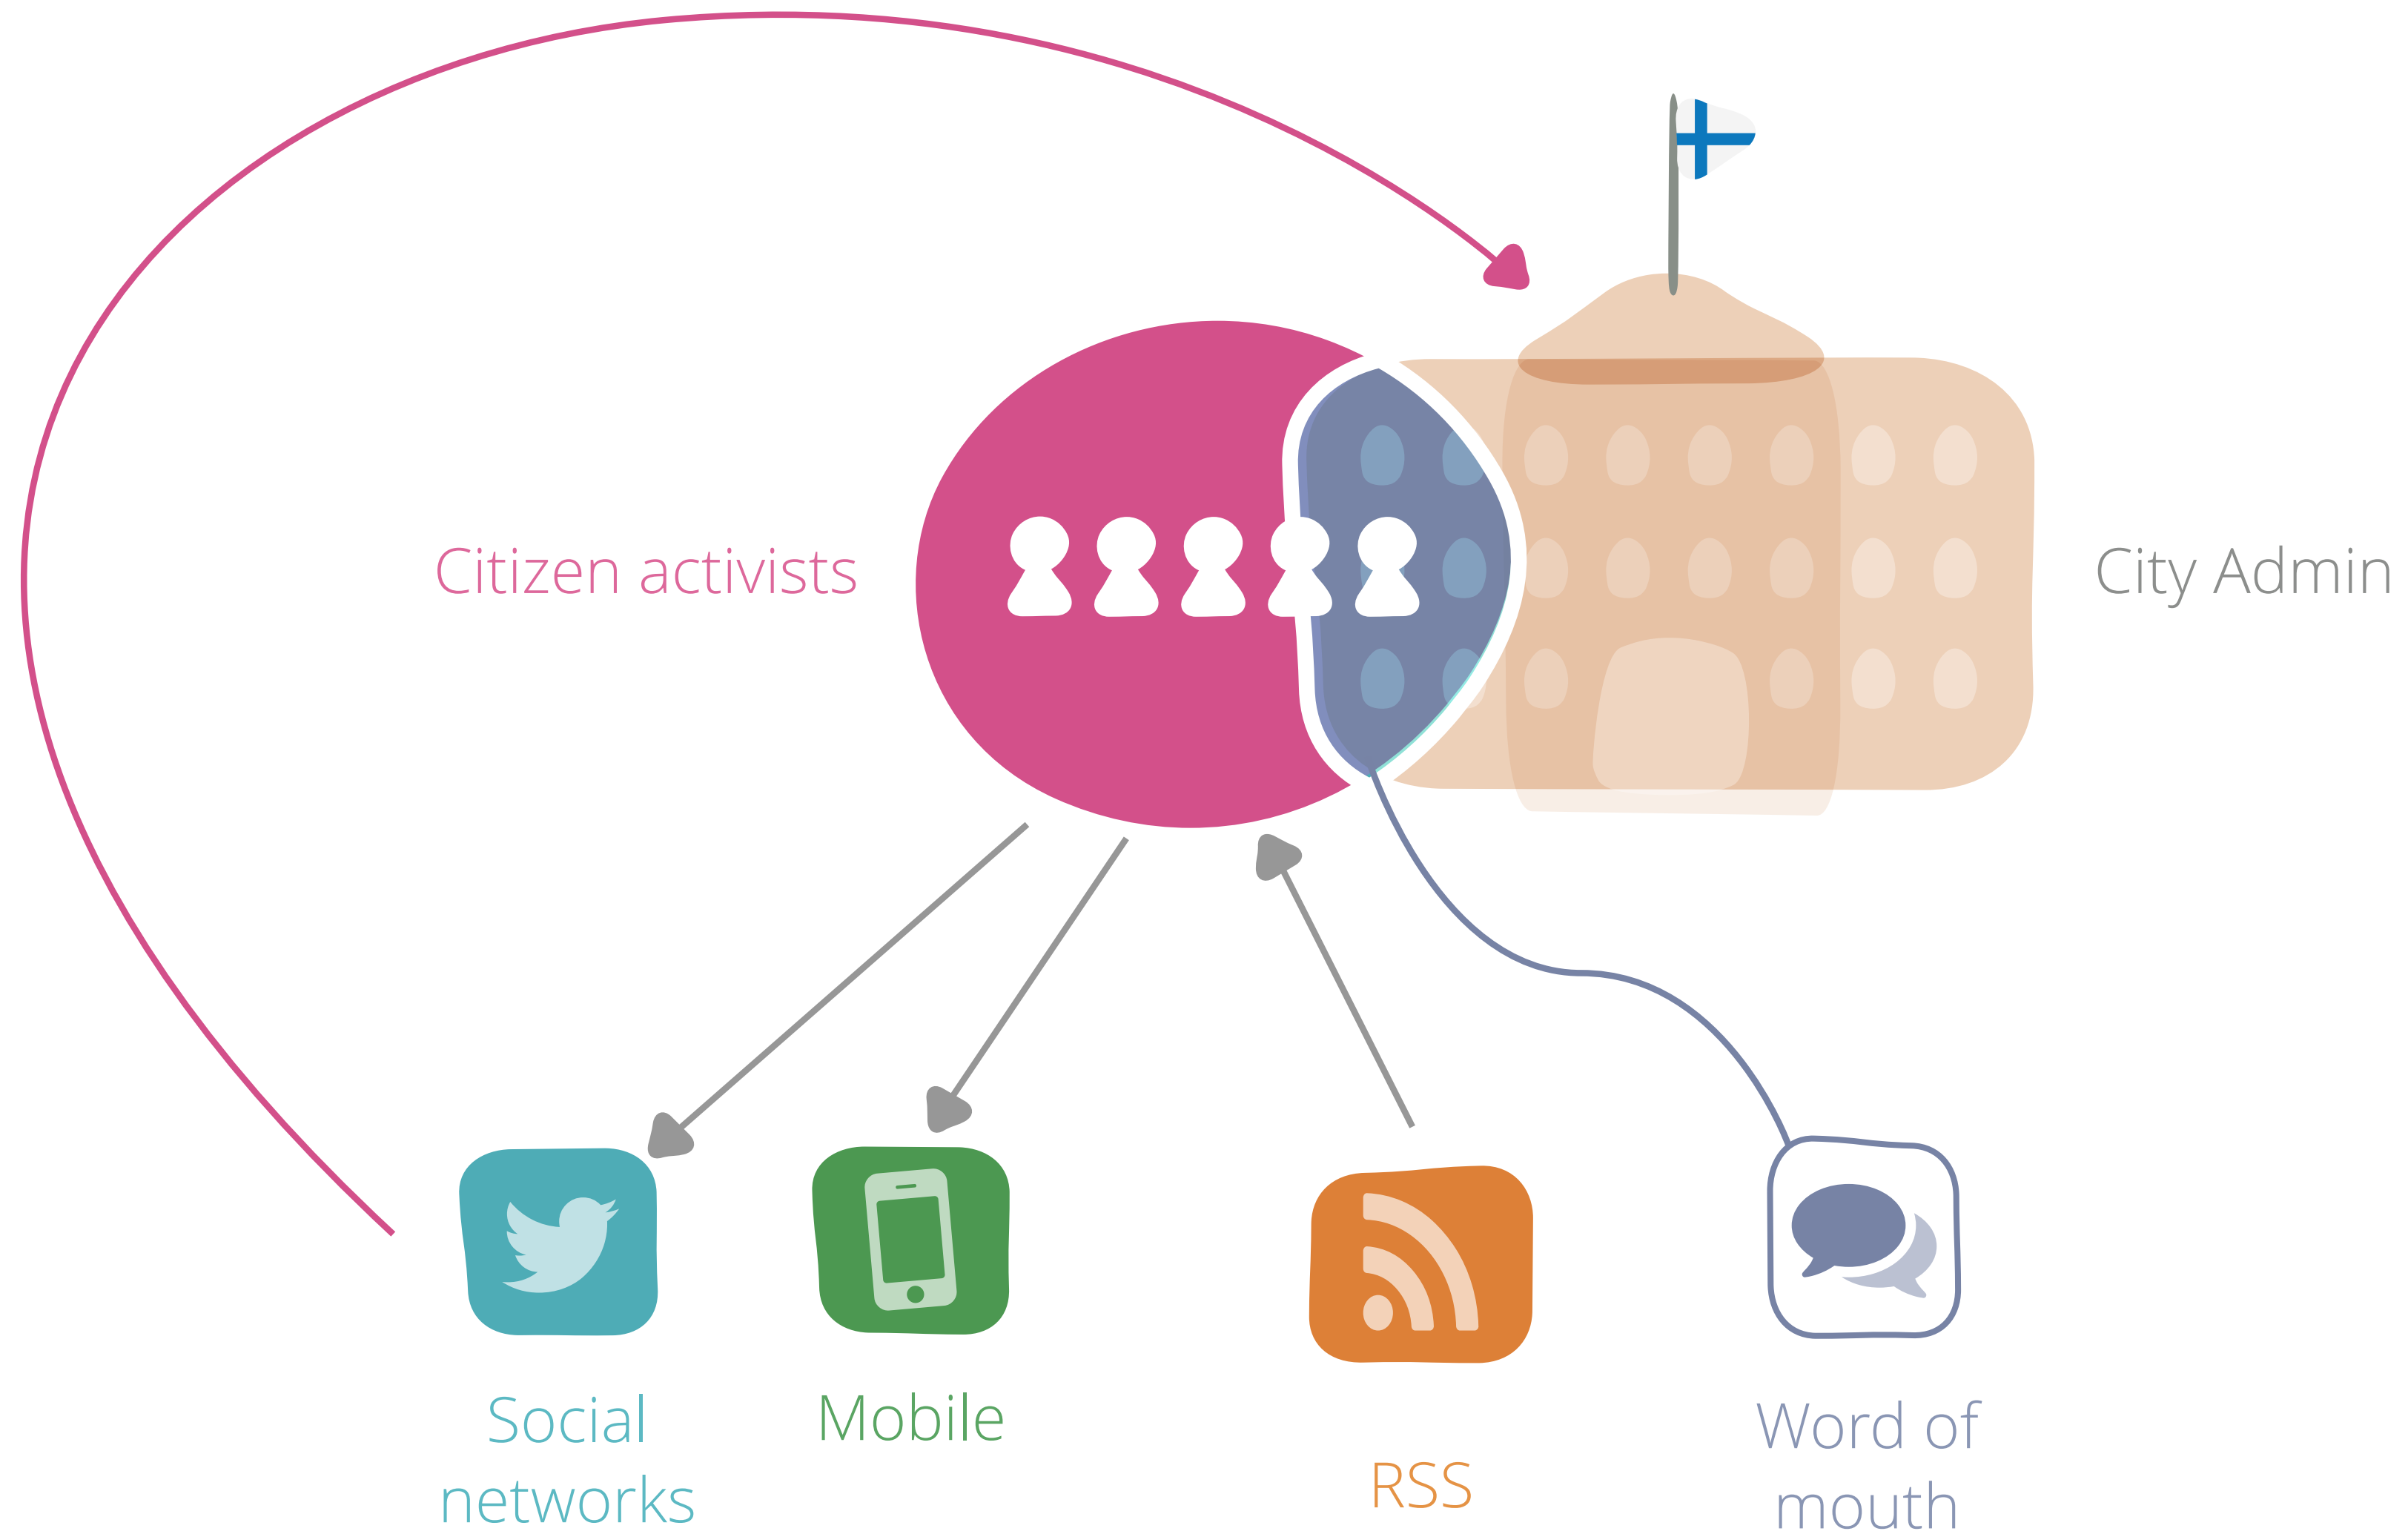

HOW WE WORKED

UNDERSTAND OPPORTUNITIES

- How we worked
- The work they have done
- Talk to users to understand the picture of how engagement currently works

EXISTING CITIZEN ENGAGEMENT

RAPID IDEATION

- Branding
- Maps
- Search
- Streets
- Topics users care about
- Don't rely on twitter

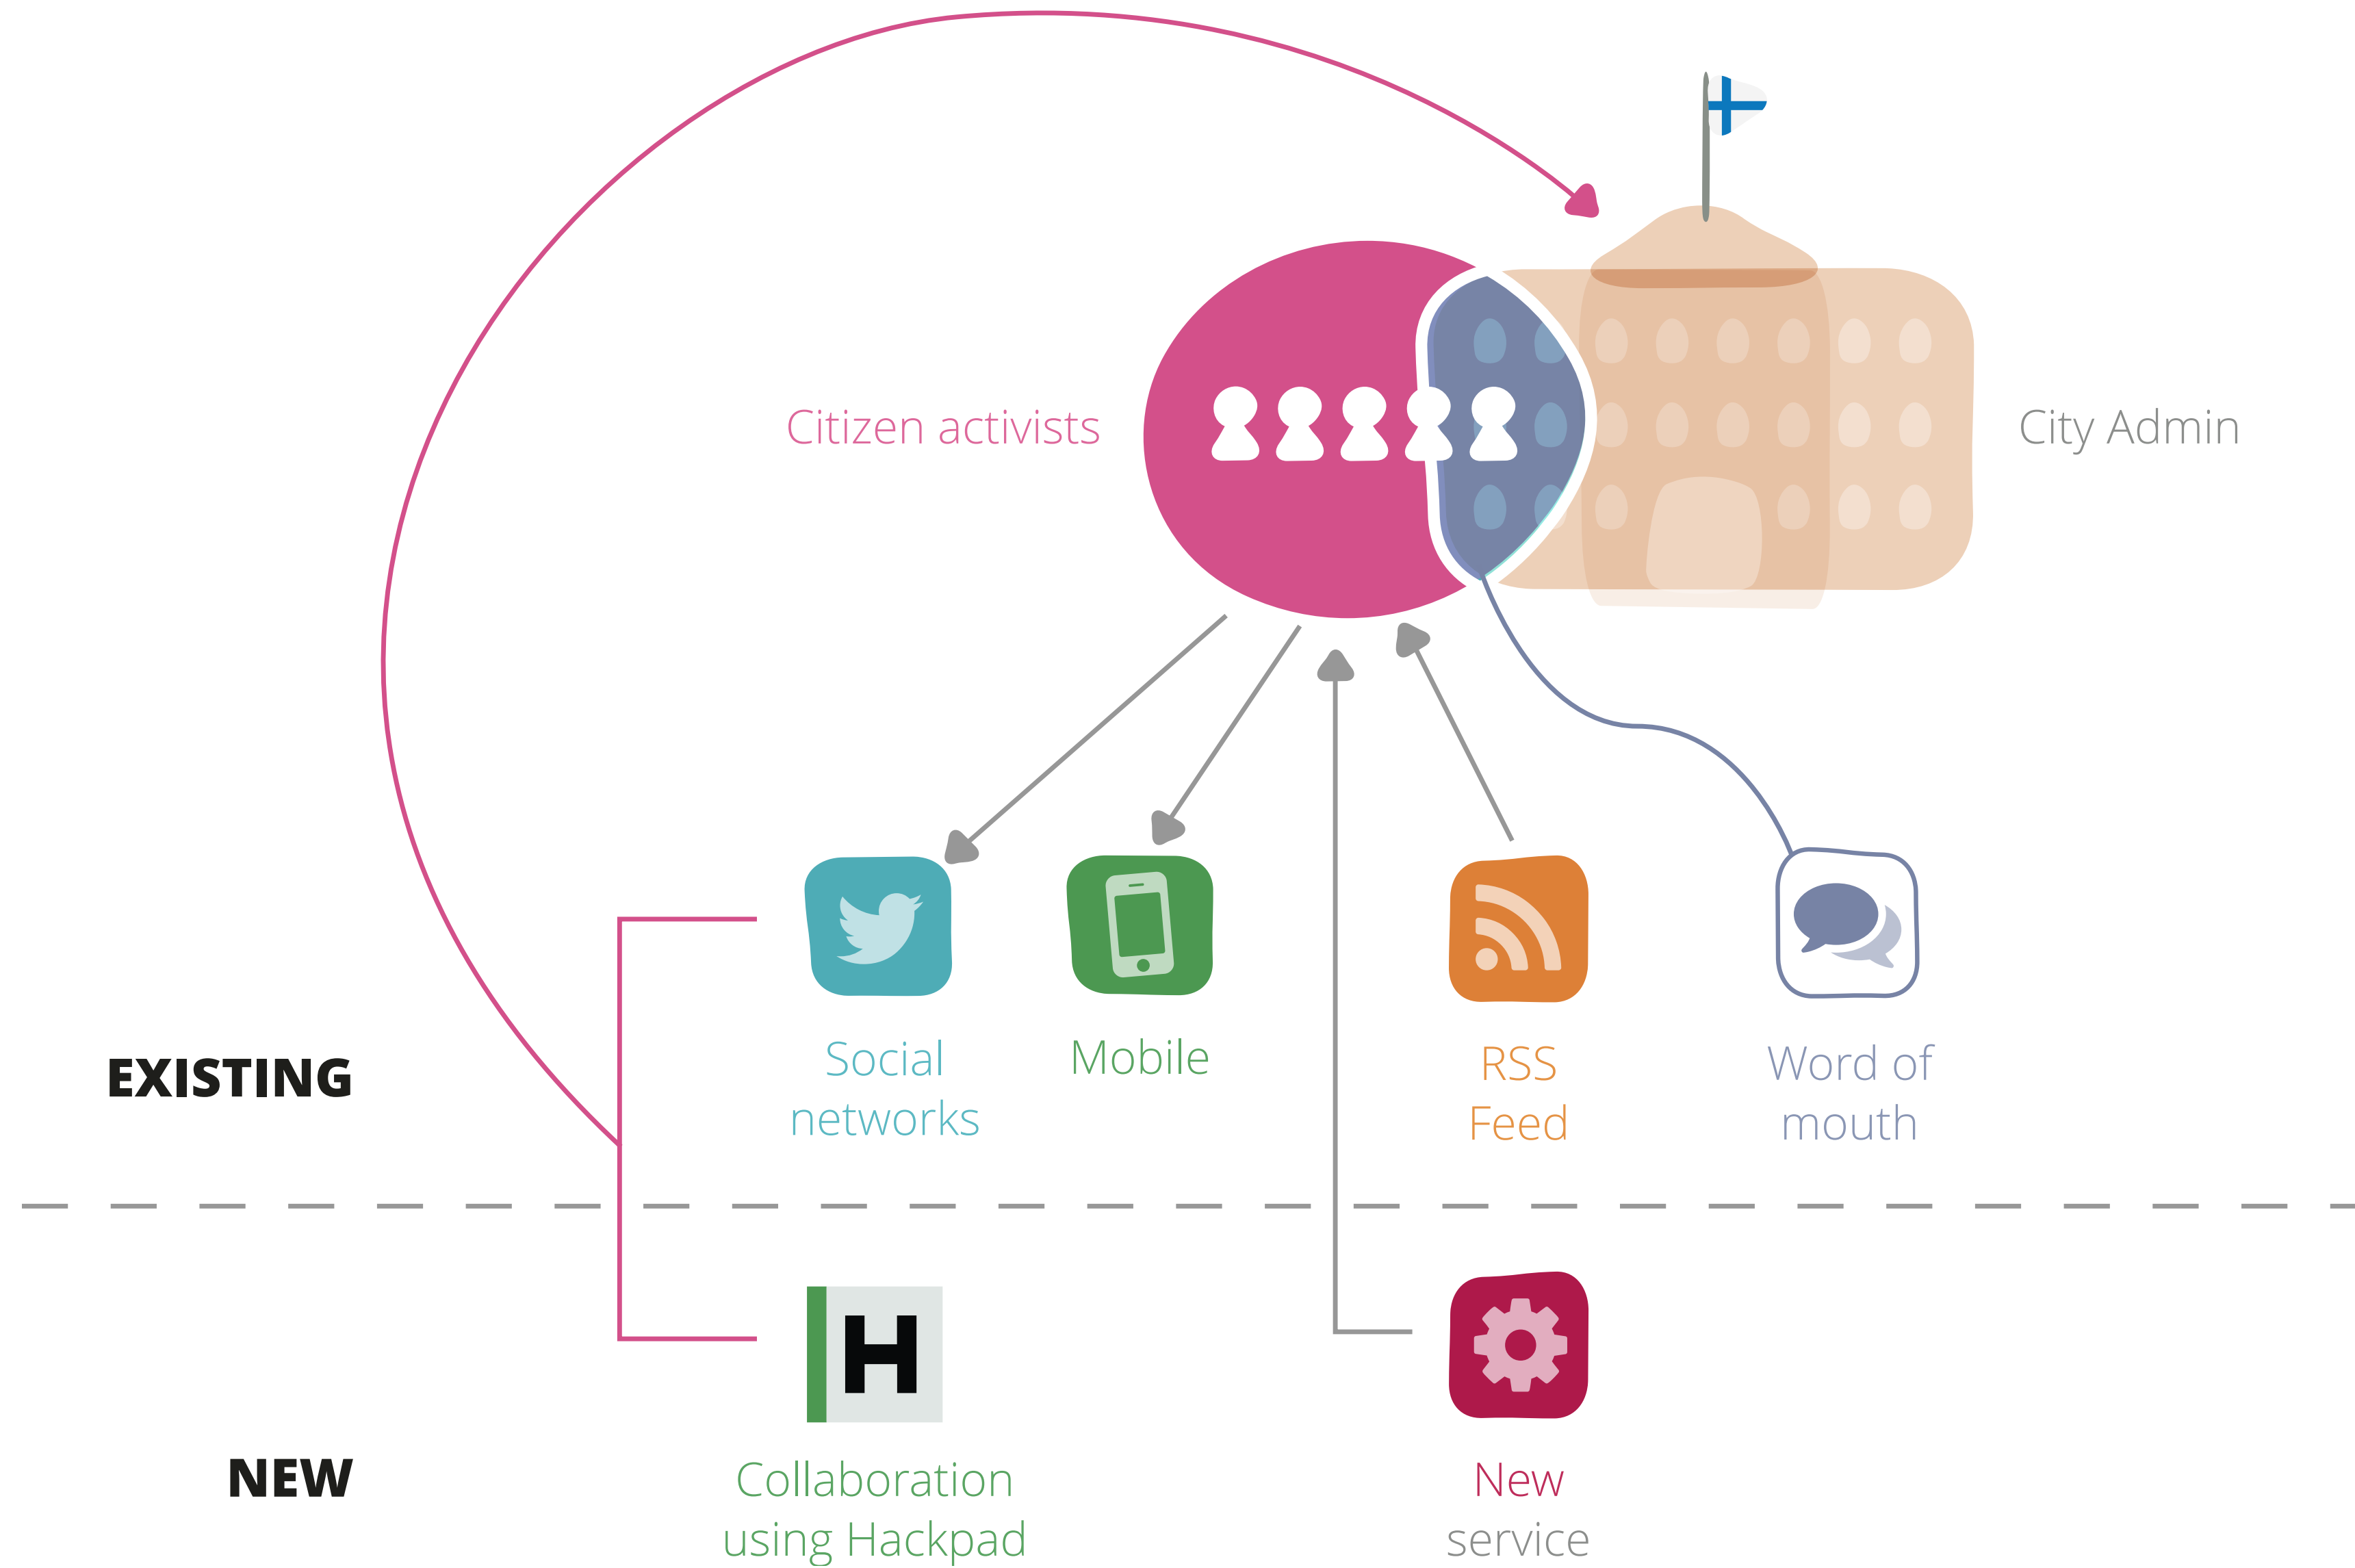

IDENTIFIED KEY FEATURES

- Simple search
- Results based on search term
- Results are ordered by relevancy to search term most recently published
- Subscription to a term
- Email updates

HYPOTHESIS

A 'PULL BASED' SYSTEM WHERE
CITIZENS CAN SUBSCRIBE TO DECISIONS
THEY CARE ABOUT WILL CREATE MORE
ONLINE AND OFFLINE POLITICAL
ENGAGEMENT

INCREASE ENGAGEMENT

USER JOURNEY WIREFRAME

DELIVERY APPROACH

DELIVERY APPROACH

- During the three days we met with citizen activists to understand their needs
- We built on top of the research which had already been done by OKFI and Forum Virium
- We gained an understanding of the problem space and the existing processes citizen activists use to influence change and perform social action
- For the first day we built a basic prototype as working software
- During the second and third days we evolved the software using feedback and ideas from citizens
- Building the software and meeting citizens in parallel allowed us to rapidly meet their requirements

ThoughtWorks®

ARCHITECTURE

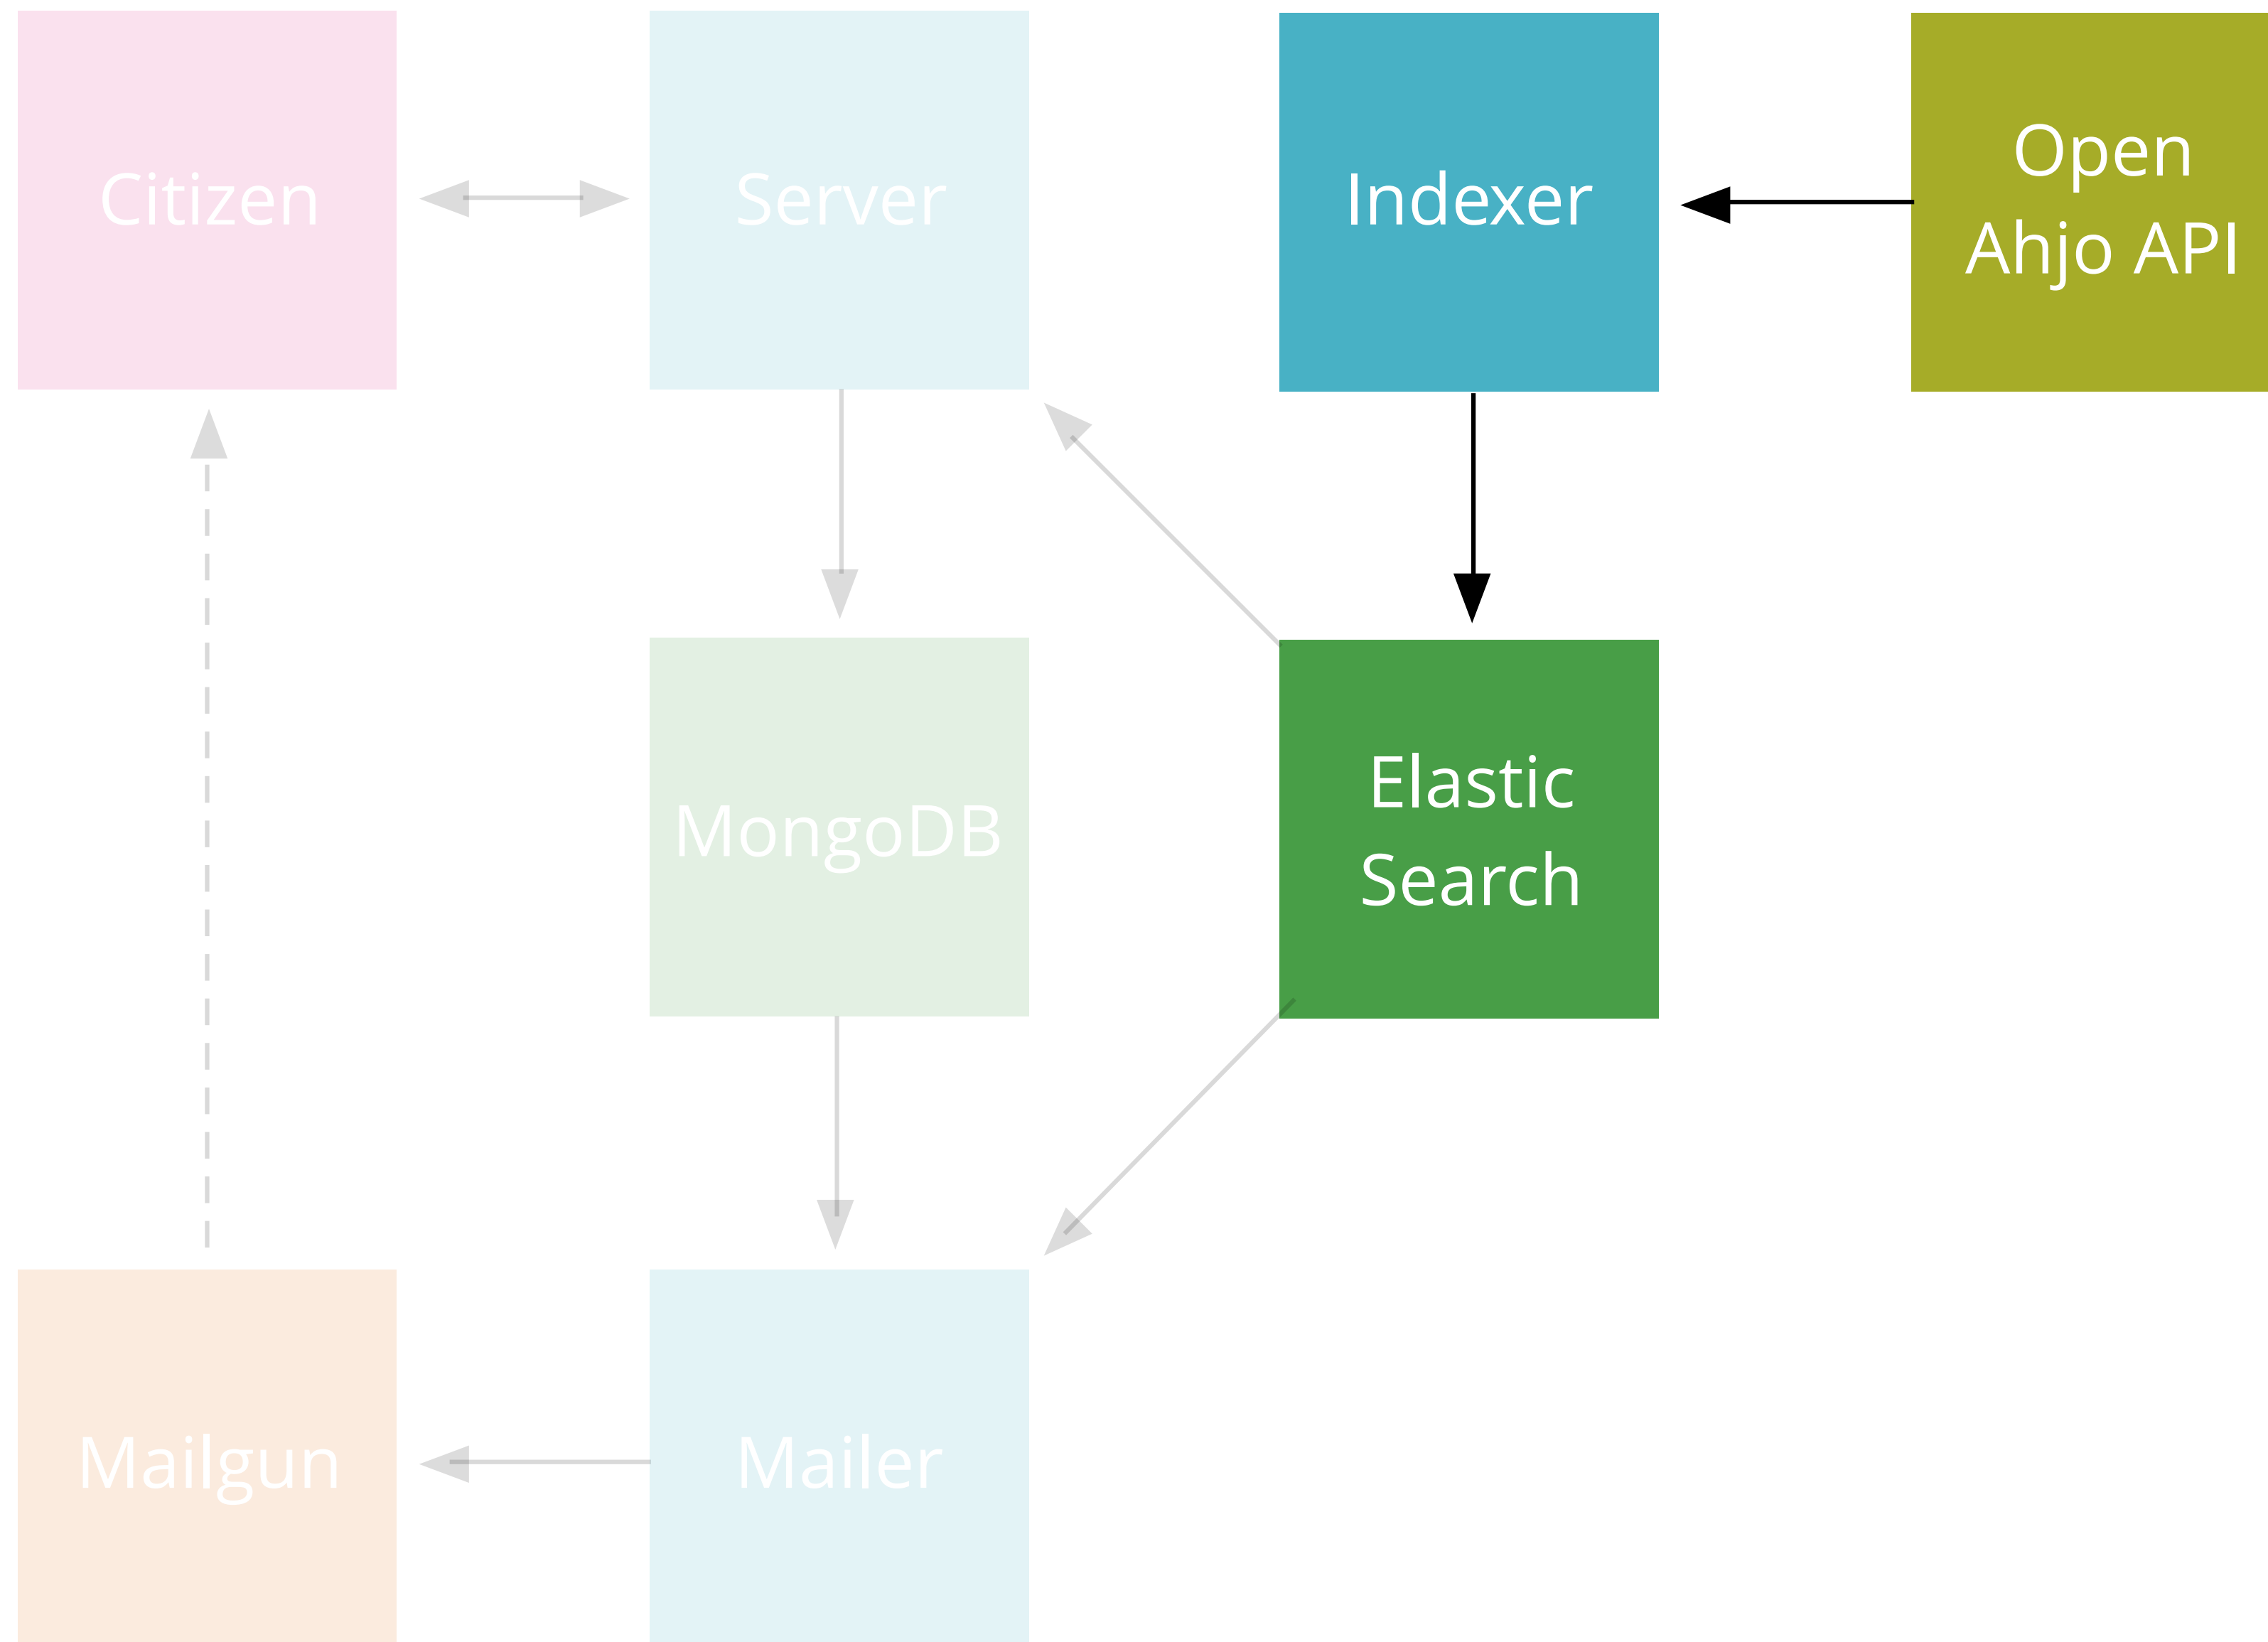

Understanding the API service

WHAT WE BUILT

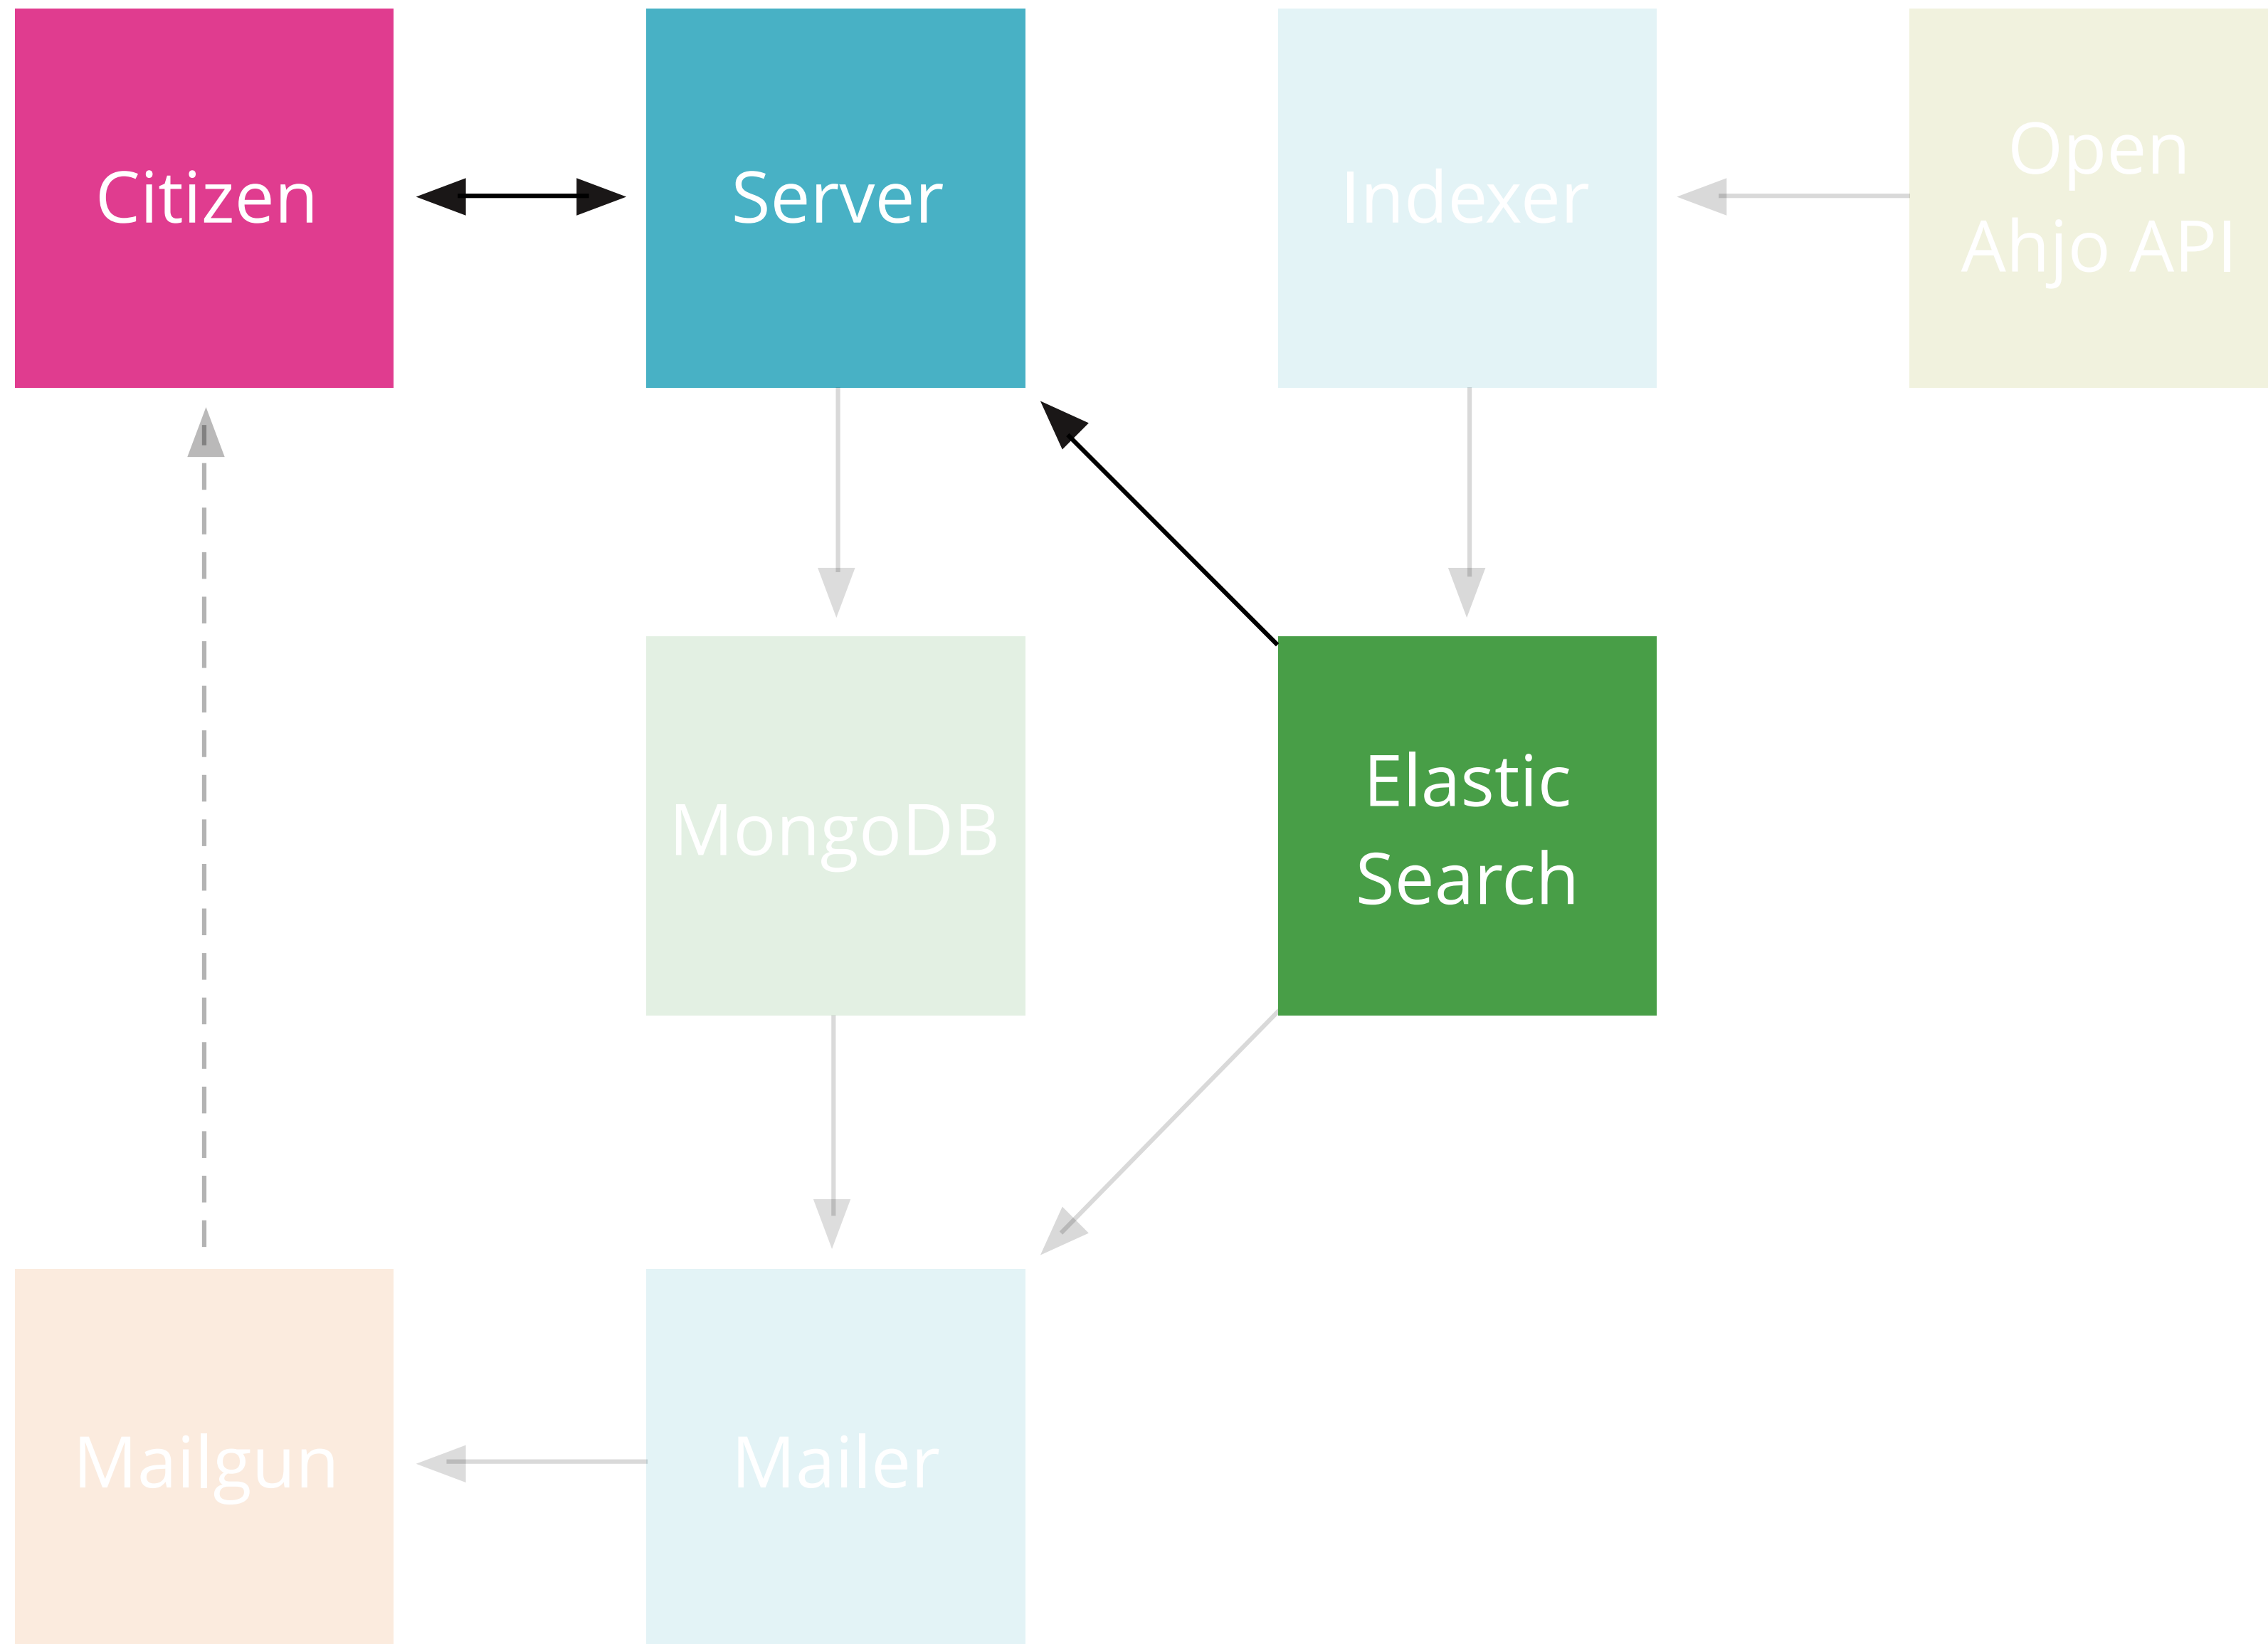

Most of the pieces of the solution were already available so we focused our time on integrating already available tools and technologies in order to rapidly prototype a solution for increasing citizen engagement with municipal decisions.

GETTING THE DATA

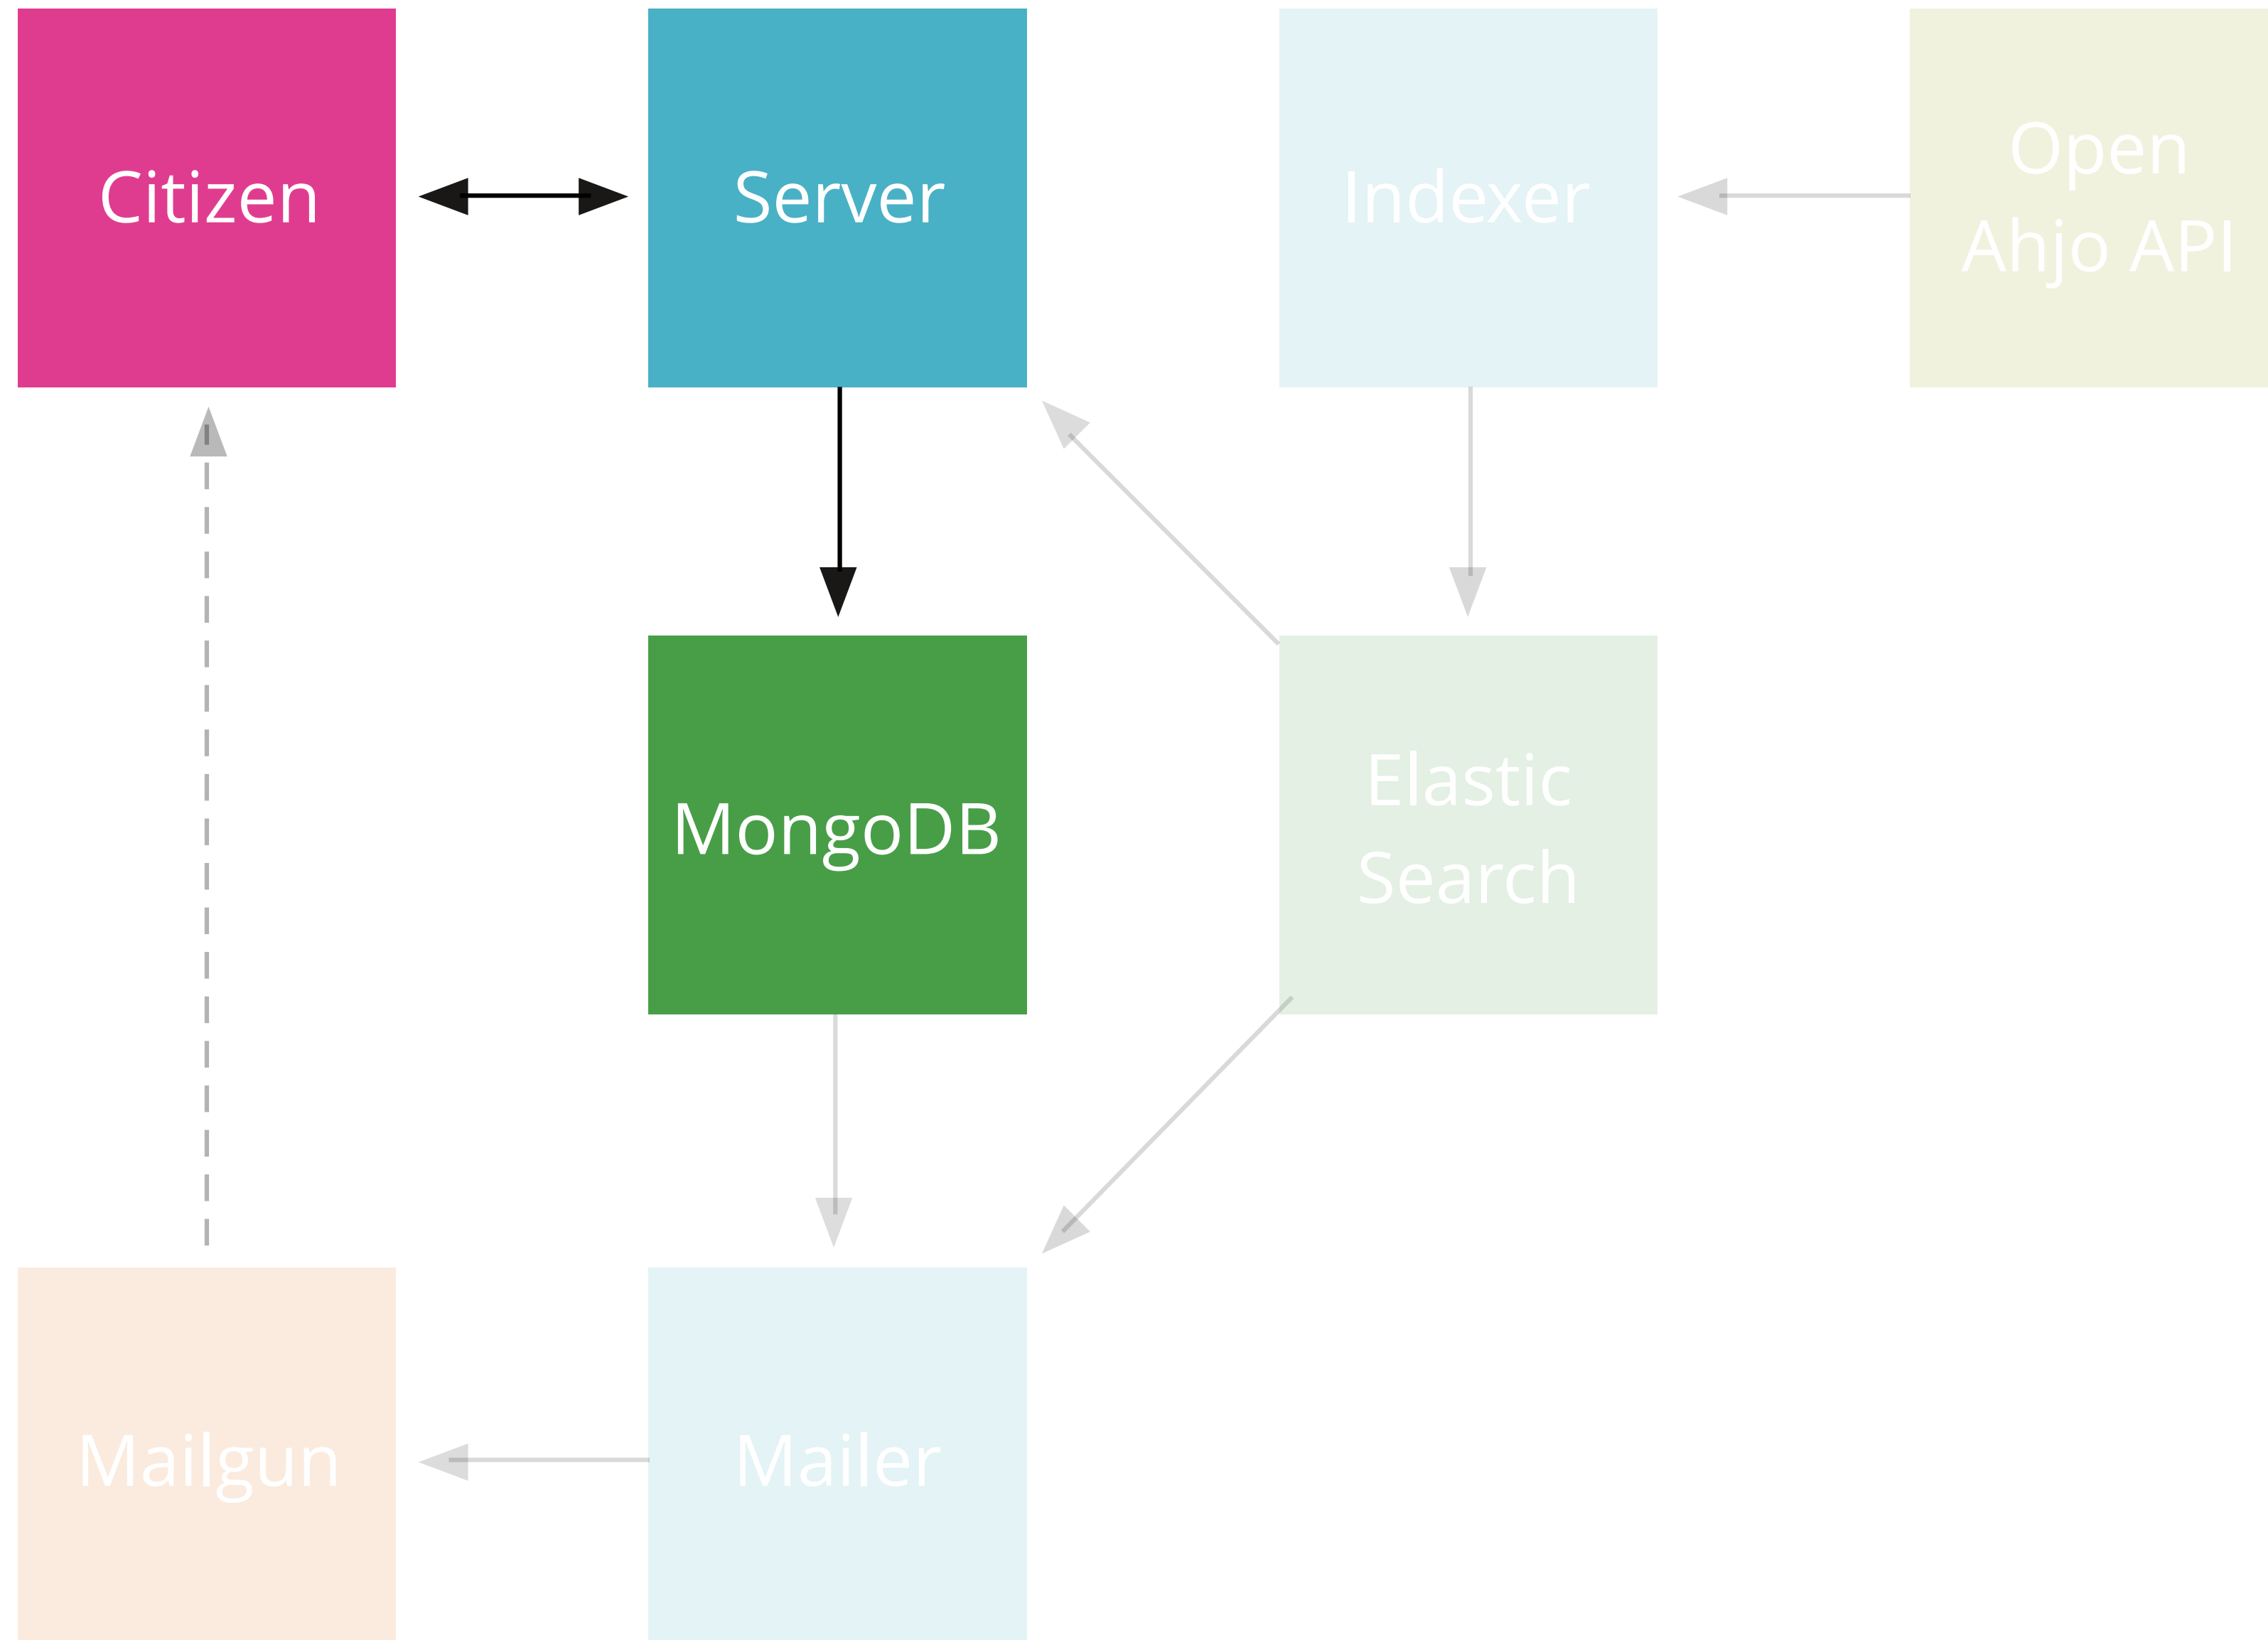

A python script pulls data from the Open Ahjo api and indexes it in the Elastic Search search engine.

Indexing the data in Elastic Search provides capability to analyse and filter the API content to better meet users interests.

PROVIDING CITIZENS WITH A SERVICE

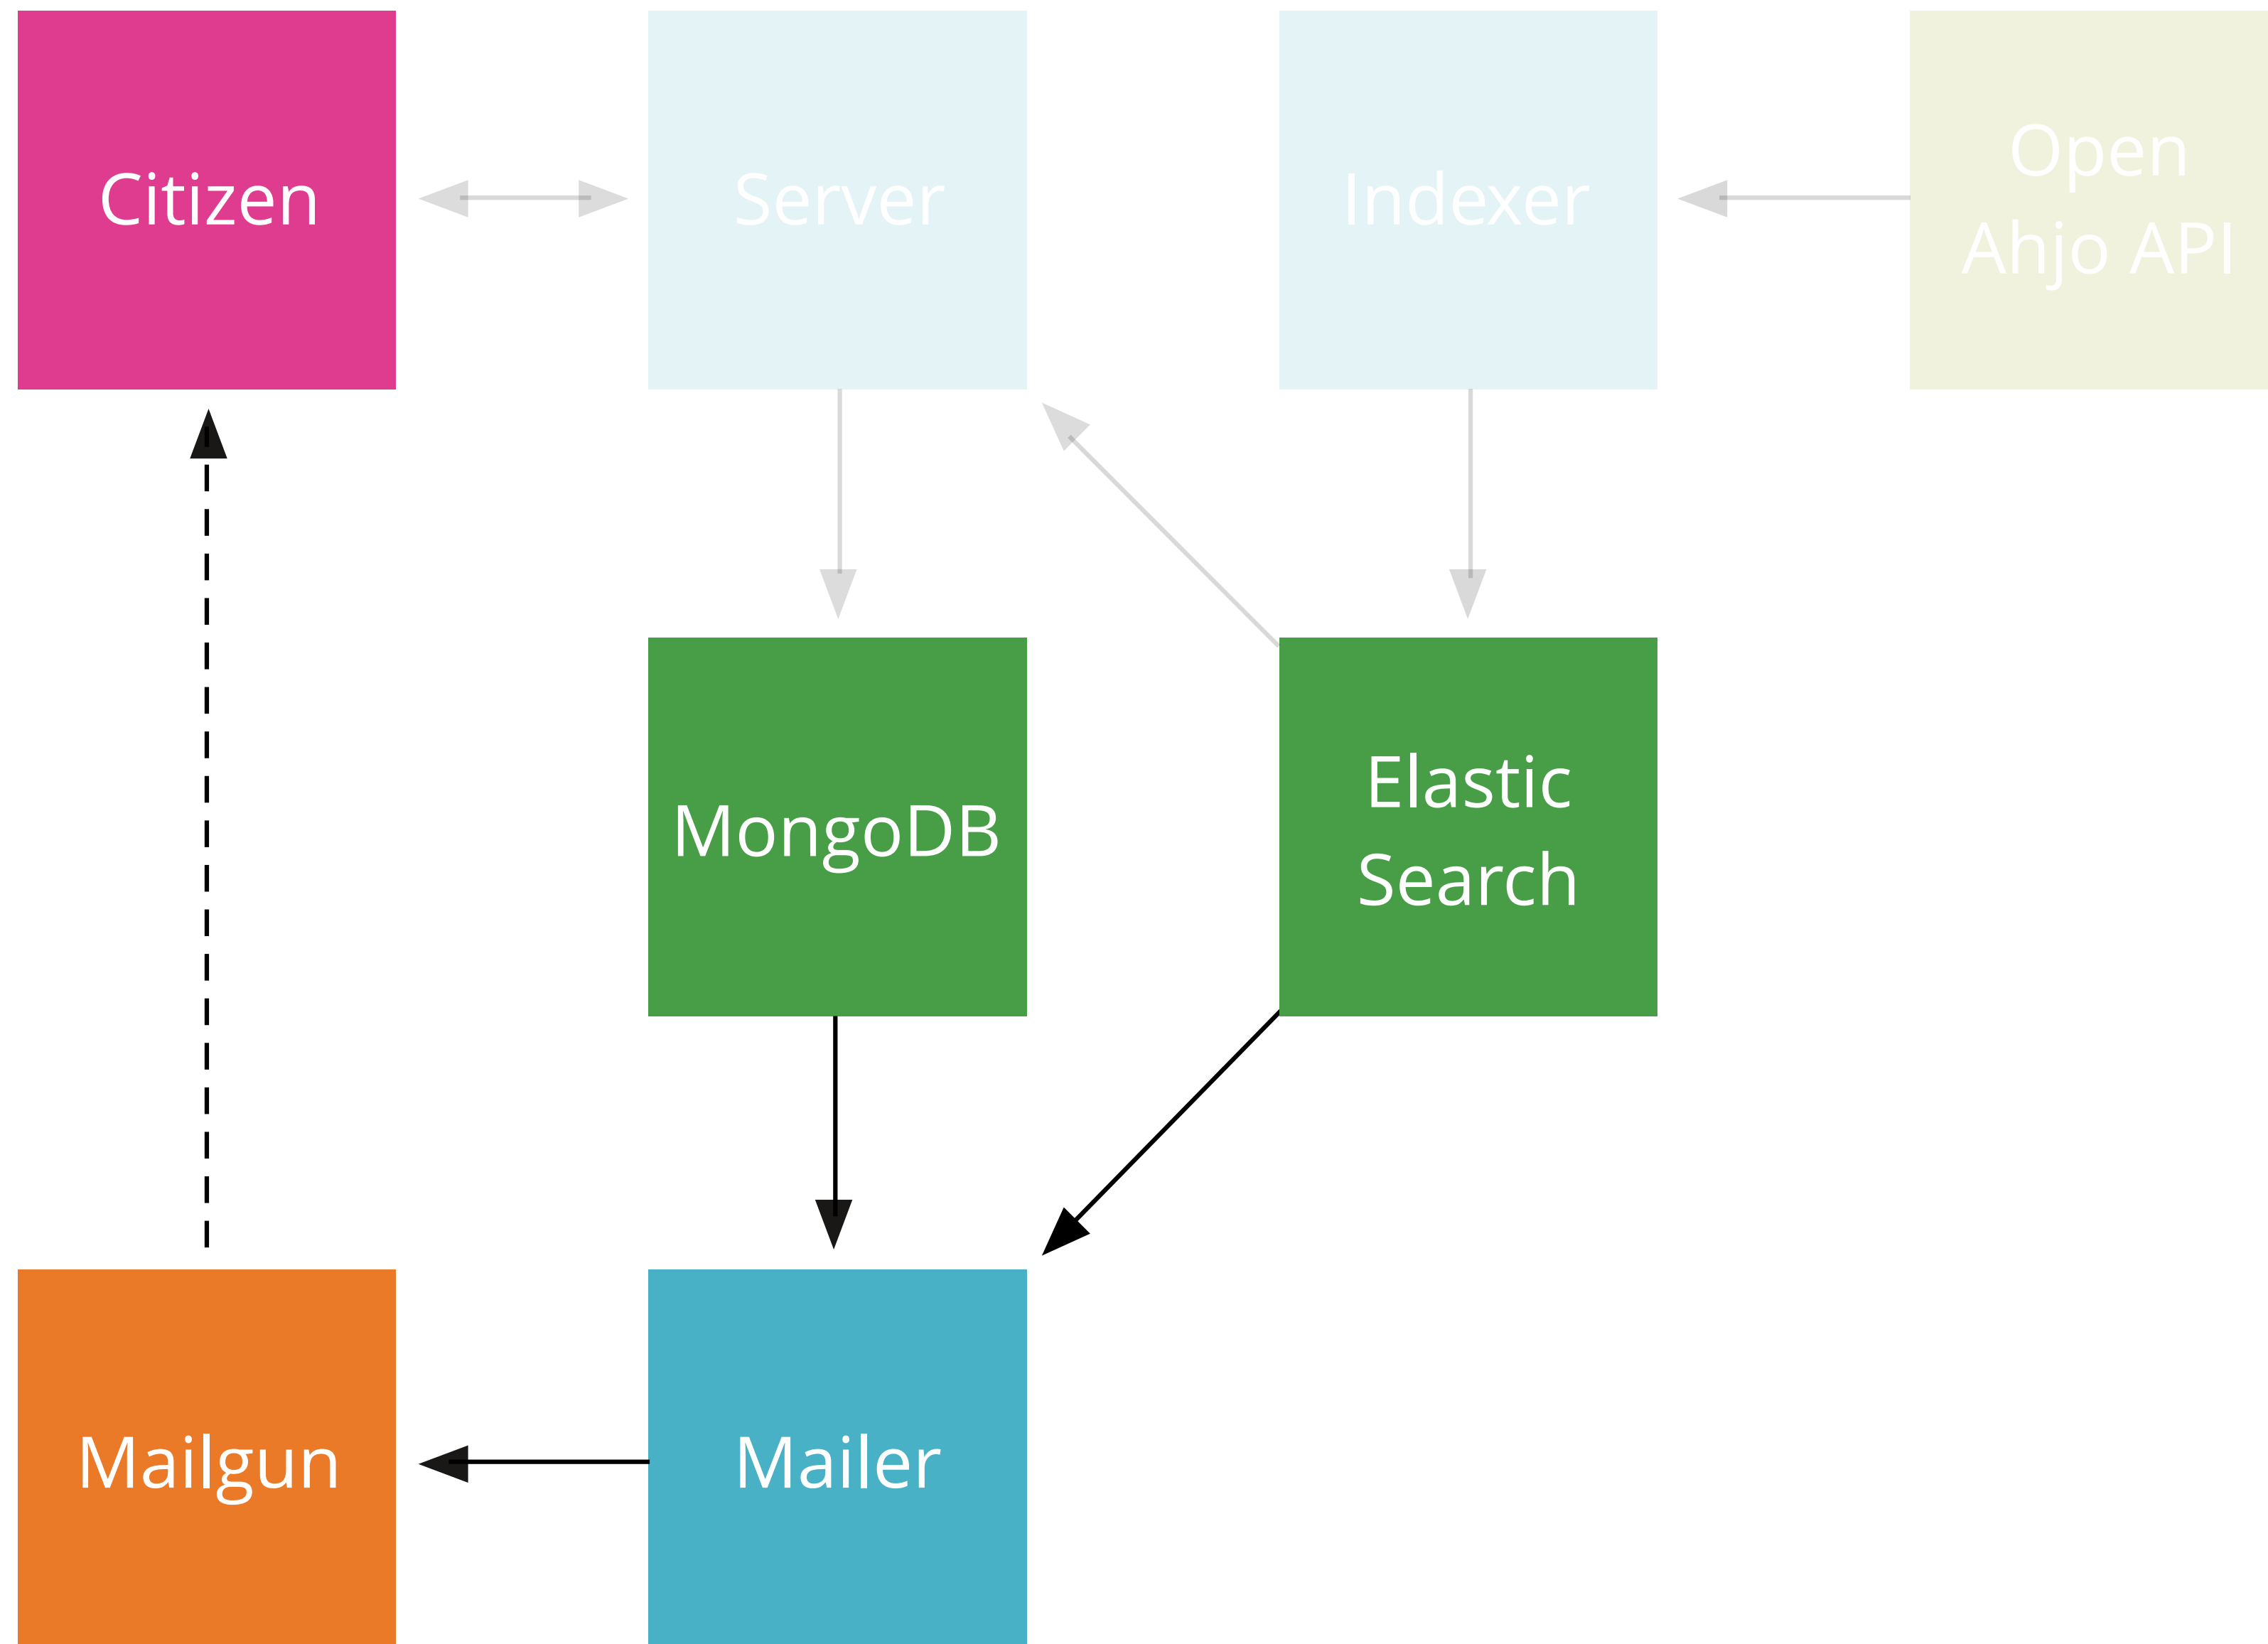

Citizens use a web site, written in python, to search for municipal decisions which match their interests.

ENABLING NOTIFICATIONS

Once a citizen has performed a search they are given the option of subscribing to future municipal decisions which match their search criteria.

When a citizen subscribes their email address and search criteria are stored in a MongoDB database.

DELIVERING NOTIFICATIONS

For every subscription in the database emails containing municipal decisions are generated and sent.

Mailgun is a transactional email service which can be triggered to send an email based on an API call from the python code.

Open Ahjo API

User

Citizen

TECH STACK

Python was chosen due to existing capability in the Helsinki open source community.

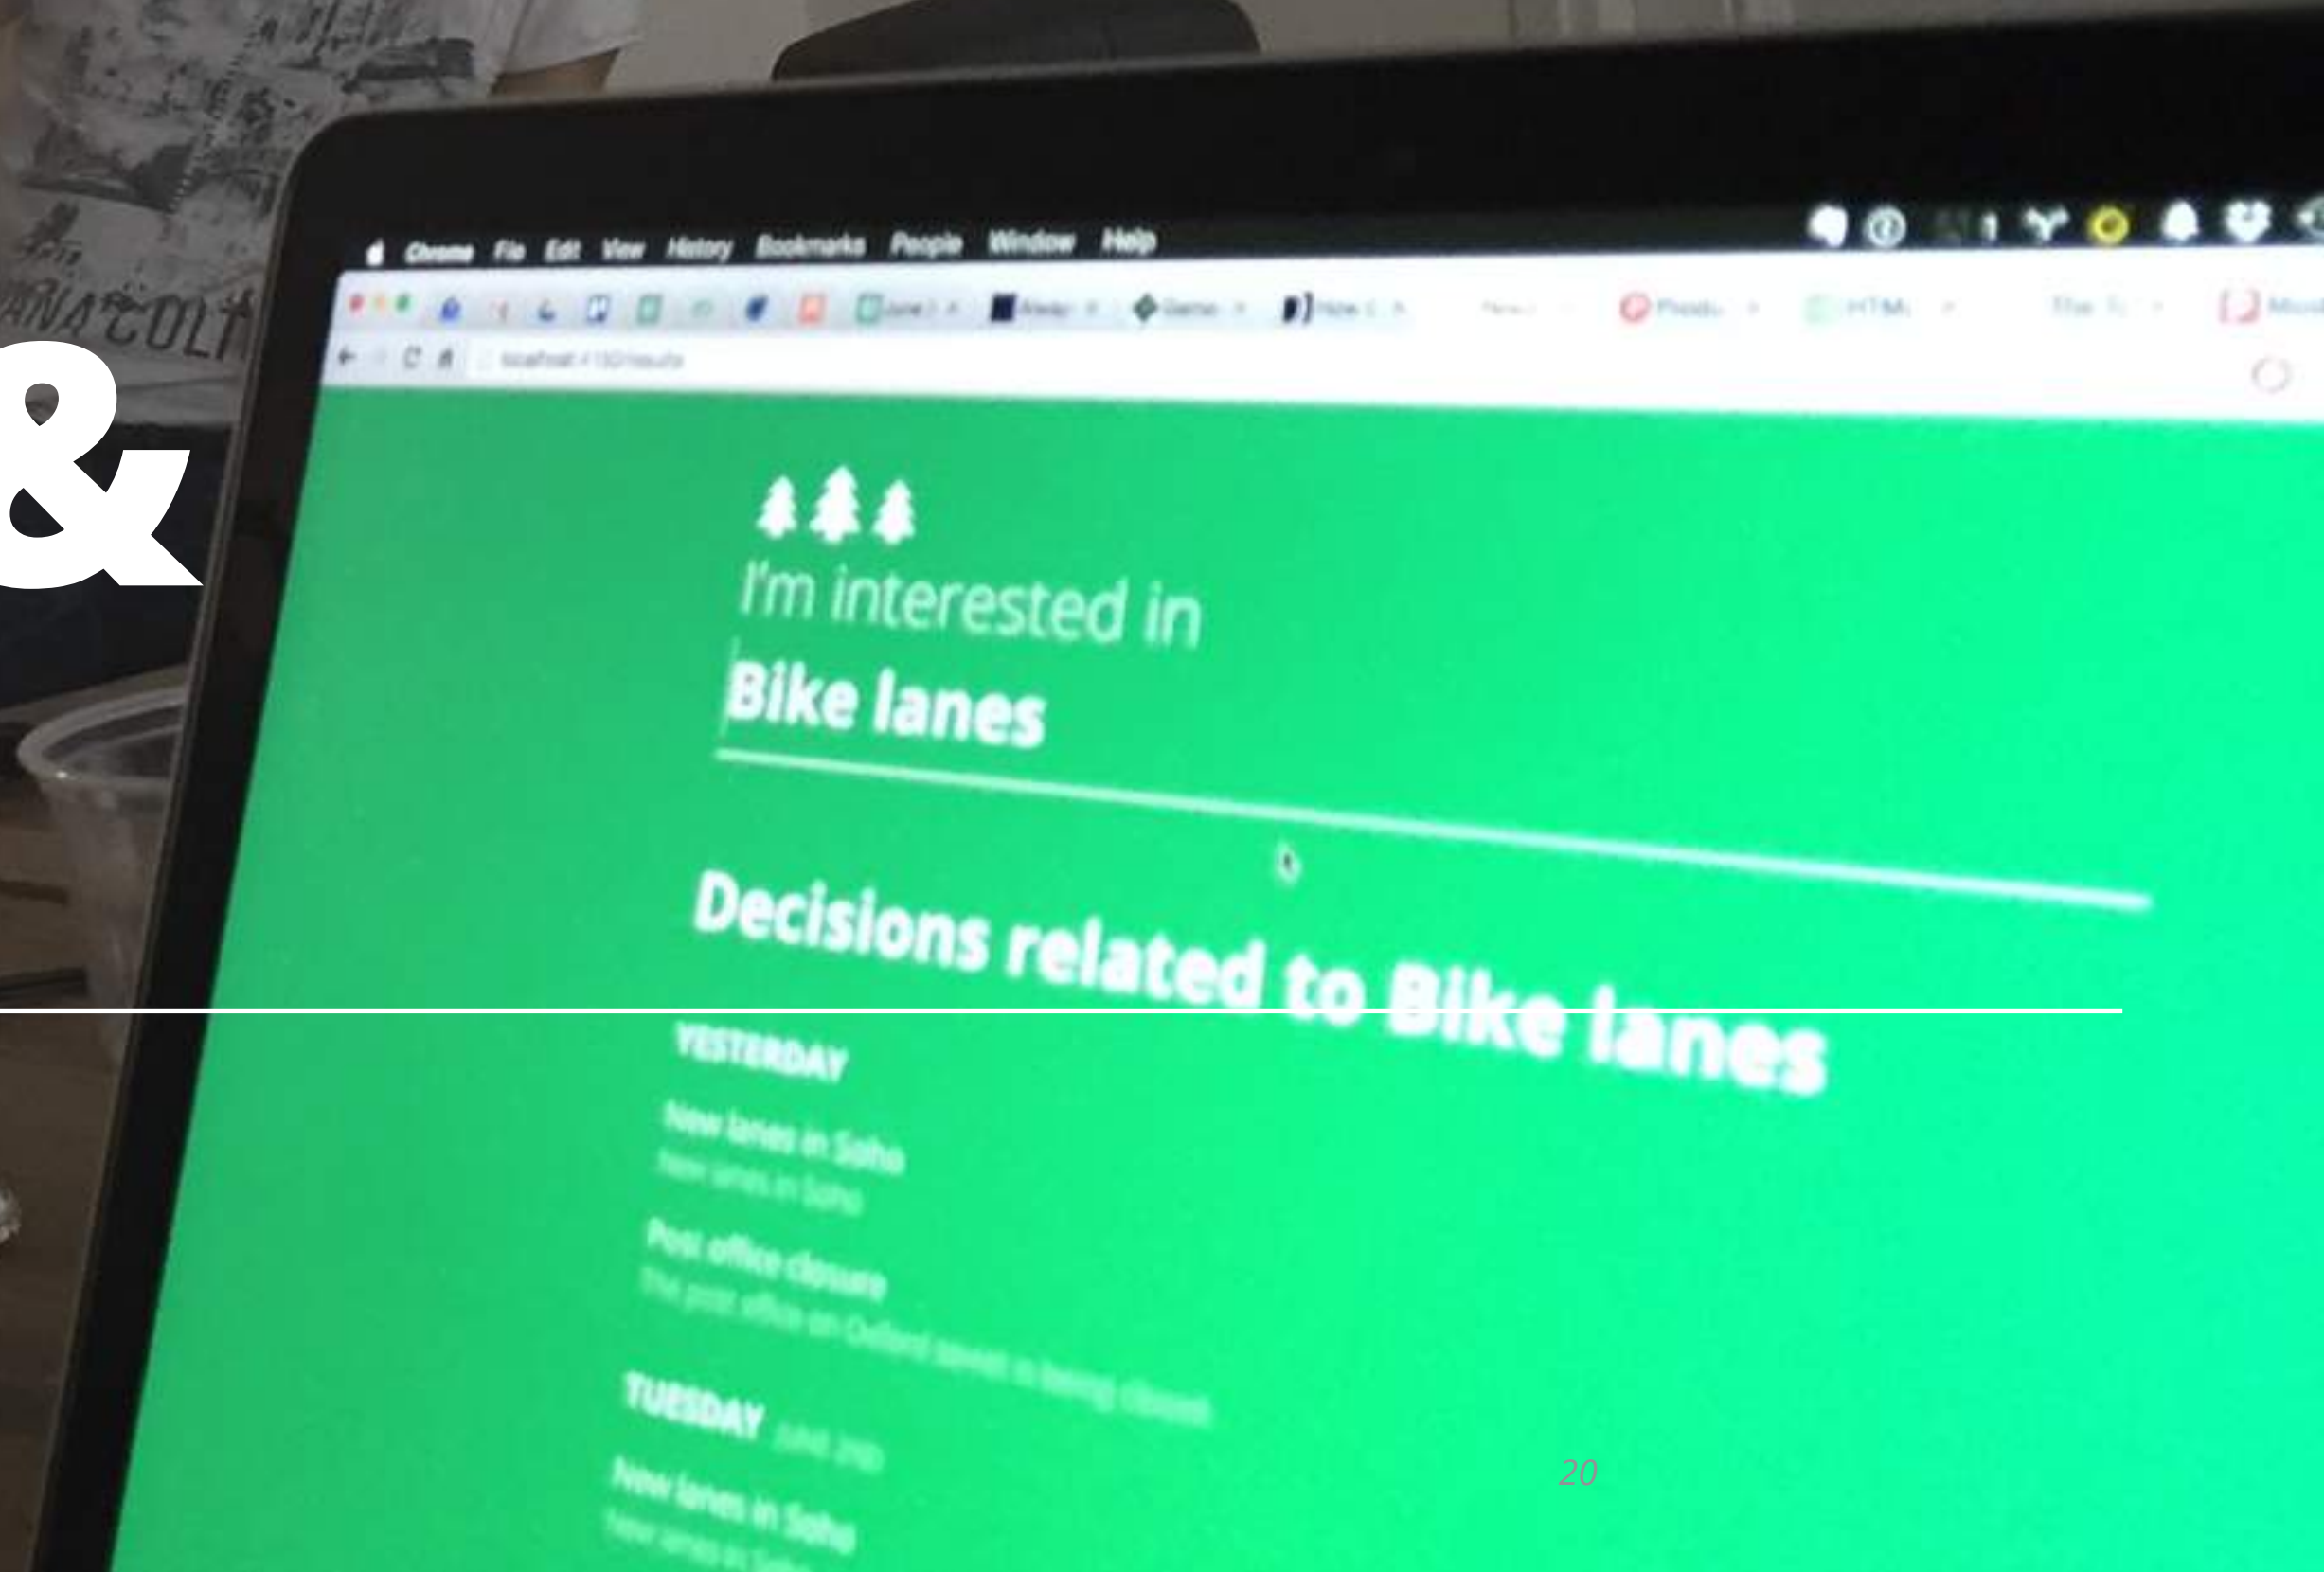

MongoDB and Elastic Search were chosen as they can be set up and configured quickly.

Mailgun is one of many transactional email services which could be used in this context.

NEXT STEPS

AREAS FOR FUTURE WORK

- These are suggestions for the next steps for the Helsinki pilot
- They should be validated with ongoing user testing and feedback
- Piloting should begin with the citizens interviewed ASAP

NEXT STEPS: MORE TARGETED SEARCH RESULTS

- Provide a wider range of more relevant results
- Add full support for the Finnish language to Elastic Search
- Work with citizens to identify meaningful data which should be used when conducting searching
- Add support for geolocation so citizens can search based on locations e.g. home, work, school
- Identify the ideal date range of results to return

NEXT STEPS: SUBSCRIPTION MANAGEMENT

- Allow citizens to update their criteria for relevant municipal decisions
- Allow citizens to unsubscribe from the notifications
- Identify frequencies at which notifications should be sent e.g. daily, weekly, monthly
- Allow citizens to control the frequency at which they receive notifications
- Provide account features for managing subscriptions

NEXT STEPS: EVOLVE SEARCH RESULTS

- Identify the data which is most useful to display to citizens
- Activity Streams format for using municipal decisions as social objects
- Provide an easily shareable URL for each decision to encourage social sharing
- Allow citizens to attach hashtags and other social context to municipal decisions for other citizens to use

NEXT STEPS: HACK PAD INTEGRATION

- Allow citizens to start social actions and collaborations by creating Hackpads from search results
- Investigate integration with other online democracy tools e.g. Objective8

THANK YOU
